

HandsMen Threads: Elevating the Art of Sophistication in Men's Fashion

Project Overview

HandsMen Threads is a dynamic organization in the luxury men's fashion industry. This project involved the implementation of a customized Salesforce CRM to centralize decentralized data and automate critical business processes. The CRM solution focuses on enhancing customer experience, improving operational efficiency, and ensuring data integrity through key features including a custom data model, real-time automations for order confirmations and loyalty management, proactive inventory alerts, and scheduled batch processing for financial updates.

Objectives

The primary objective was to build a robust, scalable Salesforce foundation that automates four core business processes to drive significant business value. The key goals were:

1. **Improve Customer Experience:** Automate immediate, personalized order confirmations to foster engagement and strengthen customer relations.
2. **Increase Customer Retention:** Implement a dynamic loyalty program that automatically updates customer statuses and rewards, encouraging repeat business.
3. **Enhance Operational Efficiency:** Establish proactive stock alerts to prevent stockouts and ensure timely restocking, optimizing inventory management.
4. **Ensure Data Integrity:** Automate nightly bulk order processing to update financial ledgers and inventory, guaranteeing accurate data for daily operations.

Phase 1: Requirement Analysis & Planning

- **Understanding Business Requirements:** The business suffered from siloed data in spreadsheets, manual customer communication, a static loyalty program, and a high risk of inventory stockouts. The CRM solves these by providing a single source of truth and automating these key areas.
- **Defining Project Scope and Objectives:** The scope was defined to deliver the four core automations (Order Confirmation, Loyalty Program, Stock Alerts, Bulk Updates) on the Salesforce Platform, excluding third-party integrations at this stage.

- **Design Data Model and Security Model:** A custom object schema was designed (see Phase 2). A centralized security model using Profiles and Permission Sets was planned to control object and field-level access.
- **Stakeholders Mapping:** Key stakeholders included the CEO, Sales Manager, Warehouse Manager, and Marketing Team.
- **Execution RoadMap:** A phased Agile approach was adopted, focusing sequentially on Data Model, Customer-Facing Automations, Operational Automations, and finally, Testing & Deployment.

Phase 2: Salesforce Development - Backend & Configurations

- **Setup environment & DevOps workflow:** The project was developed in a Salesforce Developer Edition org. Change Sets were prepared for deployment to a UAT environment.
- **Customization:**
 - **Objects & Fields:** Custom objects were created: HandsMen Customer, HandsMen Orders, HandsMen Products, Inventory, and Marketing Campaigns. Custom fields were added to capture all necessary data, such as Loyalty Status on Customer and Stock_Quantity__c on Inventory.
 - **Validation Rules:** A rule was created on the Orders object to ensure Total_Amount__c is a positive value. Another rule validates the format of the Customer_Email__c field.
 - **Automation (Flows):**
 - **Order Confirmation Flow:** A record-triggered flow that runs after an Order record is created/updated. It checks if the status is 'Confirmed' and sends a personalized email to the customer.
 - **Loyalty Program Update Flow:** A record-triggered flow on the Order object that runs after an order is paid. It calculates the customer's total purchases and updates their loyalty tier (Bronze, Silver, Gold) accordingly.

- **Low Stock Alert Flow:** A record-triggered flow on the Inventory object that runs when stock is updated. If Quantity_on_Hand__c <= 5, it automatically sends an email alert to the warehouse team.
- **Scheduled Bulk Order Update Flow:** A scheduled flow that runs daily at midnight to process bulk orders, updating financial ledger records and finalizing inventory adjustments.
- **Apex Triggers:** To handle complex business logic that extends beyond the capabilities of Flows, two Apex Triggers were developed. These triggers ensure data consistency and automate inventory management in real-time.
 - **OrderTotalTrigger:** This trigger automatically calculates the total amount of an order before it is saved to the database. It multiplies the order quantity by the unit price of the related product, ensuring financial accuracy and relieving users from manual calculation.
 - **StockUpdateTrigger:** This trigger automatically updates inventory stock levels in real-time when an order is confirmed. It prevents overselling by decrementing available stock as soon as an order is placed, maintaining accurate inventory counts.

Screenshots for Salesforce Concepts:

The screenshot shows the Salesforce Object Manager interface. At the top, there's a navigation bar with 'Setup', 'Home', and 'Object Manager'. Below this, the 'Object Manager' section is active, displaying a list of custom objects. The table has columns for LABEL, API NAME, TYPE, DESCRIPTION, LAST MODIFIED, and DEPLOYED. The objects listed are Marketing Campaign, Inventory, HandsMen Order, HandsMen Product, and HandsMen Customer, all of which are Custom Objects and have been deployed.

LABEL	API NAME	TYPE	DESCRIPTION	LAST MODIFIED	DEPLOYED
Marketing Campaign	Marketing_Campaign__c	Custom Object		11/17/2025	✓
Inventory	Inventory__c	Custom Object		11/17/2025	✓
HandsMen Order	HandsMen_Order__c	Custom Object		11/17/2025	✓
HandsMen Product	HandsMen_Product__c	Custom Object		11/17/2025	✓
HandsMen Customer	HandsMen_Customer__c	Custom Object		11/17/2025	✓

Record-Triggered Flow that automatically sends confirmation emails when orders are confirmed

Record-Triggered Flow on Inventory object that alerts warehouse team when stock levels are low

Scheduled Flow that updates every 2:23AM depending on the total purchases of the customer

Validation rules ensure Total Amount is positive and Customer Email follows correct format

StockTotalTrigger

Phase 3: UI/UX Development & Customization

- **Lightning App Setup:** A custom Lightning App named "HandsMen Threads" was created via App Manager, consolidating all relevant tabs (Customers, Orders, Products, etc.).
- **Page Layouts & Dynamic Forms:** Custom Lightning Record Pages were built for the Customer and Order objects, logically grouping fields and related lists to guide the user through the process.
- **User Management:** Standard Salesforce user management is utilized.

Phase 4: Data Migration, Testing & Security

This phase ensured the successful transition of data into the new system, validated all functionality through rigorous testing, and established a robust security model to protect sensitive business information.

Data Migration & Integrity

- **Data Loading Process:** The initial migration of master data (Products, Customers, and Inventory records) was performed using the **Data Import Wizard** due to its user-friendly interface for volumes under 50,000 records. For ongoing data loads or larger datasets, the **Data Loader** will be the standard tool.
- **Field History Tracking:** Field History Tracking was enabled on critical fields to maintain an audit trail. Key examples include:
 - **HandsMen Customer Object:** Loyalty_Status__c, Total_Purchases__c
 - **HandsMen Orders Object:** Status__c, Total_Amount__c
 - **Inventory Object:** Stock_Quantity__c

Restriction Rules	Total Purchases	Total_Purchases__c	Number(18, 0)
Scoping Rules			
Object Access			

- **Duplicate Management:** To maintain a clean database, Duplicate Rules were implemented on the **HandsMen Customer** object. A standard matching rule (e.g., "Exact Match on Email") was created and enforced by a duplicate rule that blocks the creation of duplicate customer records based on the email address.

Security Model

A layered security model was designed to ensure users have access only to the data and functions necessary for their roles.

- **Profiles:** Custom profiles were created to mirror job functions.
 - **Sales Profile:** Read/Create/Edit access to Customers, Orders, and Products. Read-only access to Inventory.
 - **Warehouse Profile:** Read/Edit access to Inventory and Products. Read-only access to Orders.

- **Roles and Role Hierarchy:** A role hierarchy was established to mirror the organizational structure and allow for record sharing. For example, Sales Managers have access to the records owned by their team's Sales Representatives.

The screenshot shows the 'Roles' setup page in Salesforce. The left sidebar contains navigation links for Users, Roles (selected), Feature Settings, Sales, Service, and Case Teams. The main content area is titled 'Creating the Role Hierarchy' and displays a tree view of the role hierarchy for 'Polytechnic University of the Philippines Santo Tomas Campus'. The hierarchy starts with 'CEO' at the top, followed by 'CFO', 'COO', 'Inventory', 'Marketing', 'Sales', 'SVP, Customer Service & Support', 'Customer Support, International', 'Customer Support, North America', and 'Installation & Repair Services'. Each role has an 'Add Role' button and links for 'Edit', 'Del', and 'Assign'.

- **Sharing Rules:** While the Role Hierarchy handles most record visibility, a sharing rule was created to grant Read access for all Warehouse users to all Order records, enabling them to view order details for fulfillment purposes without changing record ownership.

The screenshot shows the 'Sharing Settings' page in Salesforce. The left sidebar contains navigation links for Setup, Home, Object Manager, and Security. The main content area is titled 'Sharing Settings' and displays a table of sharing rules. The table has three columns: 'Object', 'Private', and 'Public Read/Write'. The 'Object' column lists various objects, and the 'Private' and 'Public Read/Write' columns show the sharing settings for each object. A 'Share' button is visible at the bottom right of the table.

Testing & Quality Assurance

A comprehensive testing strategy was executed to validate all customizations.

- **Test Classes:** Apex test classes were developed for the custom triggers to ensure they meet the 75% code coverage requirement for deployment and function correctly in bulk scenarios.
 - **OrderTotalTriggerTest:** Creates test product and order records, verifies that the `Total_Amount__c` is correctly calculated as `Quantity__c * Price__c`.
 - **StockUpdateTriggerTest:** Creates test inventory and order records, confirms that updating an order status to 'Confirmed' correctly decrements the `Stock_Quantity__c` on the related inventory record.
- **Functional Test Cases:** The following test cases were executed for key features. Each test was documented with input actions, expected results, and actual results, accompanied by screenshots.

Test Case 1: Automated Order Confirmation Flow

- **Test Steps:**
 1. Navigate to the HandsMen Orders tab.
 2. Create a new Order for a customer with a 'Draft' status.
 3. Save the order.
 4. Edit the order and change the status to 'Confirmed'.
- **Expected Result:** Upon saving the order with 'Confirmed' status, a confirmation email is immediately sent to the customer's email address.
- **Actual Result:** The email was sent successfully. The email alert was found in the debug logs, and the customer received the email.
- **Status:** PASSED

Test Case 2: Dynamic Loyalty Program Update

- **Test Steps:**

1. Locate a test customer with a 'Bronze' status and \$0 total purchases.
2. Create a new Order for this customer with a Total Amount of \$1,200.

- **Expected Result:** The customer's Loyalty Status is automatically upgraded from Bronze to Gold.
- **Actual Result:** The customer's record was updated to Gold status after the custom time.
- **Status:** PASSED

Test Case 3: Proactive Low Stock Alert

- **Test Steps:**
 1. Navigate to an Inventory record for a popular product.
 2. The current stock is 6.
 3. Edit the record and change the Stock_Quantity__c to 4.
 4. Save the record.
- **Expected Result:** An email alert is sent to the Warehouse Team's distribution list notifying them of the low stock.
- **Actual Result:** The email was successfully generated and sent. The warehouse team confirmed receipt.

- **Status: PASSED**

Test Case 4: OrderTotalTrigger Validation

- **Test Steps:**

1. Create a new Order record.
2. Select a Product (i.e. "Jacket" with a price of \$10.)
3. Enter a Quantity of 50.
4. Save the record.

- **Expected Result:** The Total_Amount__c field is automatically calculated and populated with \$500.00.
- **Actual Result:** The field was correctly populated with \$500.00 upon saving.
- **Status:** PASSED

The screenshot shows the Salesforce interface for the 'HandsMen Orders' page. The top navigation bar includes 'HandsMen Threads', 'HandsMen Customers', 'HandsMen Orders' (selected), 'HandsMen Products', 'Inventories', 'Marketing Campaigns', 'Reports', 'Dashboards', 'Accounts', and 'Contacts'. A search bar is present in the top right. Below the navigation bar, the page title is 'HandsMen Order O-0009'. On the right, there are buttons for 'New Contact', 'Edit', and 'New Opportunity'. The main content area is divided into 'Related' and 'Details' tabs. The 'Details' tab is active, showing a list of fields for the order: HandsMen OrderNumber (O-0009), HandsMen Product (Jacket), HandsMen Customer (James), Status (Confirmed), Quantity (50), Total Amount (500), Customer Email (Jeromecarandang011@gmail.com), and Created By (Jeronimo Carandang, 11/24/2025, 12:42 AM). The 'Owner' field is also visible, showing Jeronimo Carandang. The 'Last Modified By' field shows Jeronimo Carandang, 11/24/2025, 12:43 AM.

Test Case 5: StockUpdateTrigger Validation

- **Test Steps:**
 1. Note the Stock_Quantity__c (e.g., 100) for a product's Inventory record.
 2. Create a new Order for that product with a Quantity of 20 and set Status to 'Confirmed'.
 3. Save the order.
- **Expected Result:** The related Inventory record's Stock_Quantity__c is automatically decremented to 80.
- **Actual Result:** The inventory was successfully updated to 80.

- **Status: PASSED**

Phase 5: Deployment, Documentation & Maintenance

- **Deployment Strategy:** Deployment from the development environment to a UAT sandbox will be performed using Change Sets. Post-UAT approval, the same Change Sets will be used for production deployment.
- **Maintenance and Monitoring:** System maintenance will include monitoring scheduled job failures, reviewing debug logs for automation errors, and performing regular data backups.
- **Troubleshooting Approach:** Salesforce DevOps Center and Debug Logs will be the primary tools for tracking and resolving issues post-deployment.

Conclusion

The HandsMen Threads project successfully delivered a fully functional, scalable Salesforce CRM tailored to the luxury men's fashion industry. By centralizing data and implementing four critical automations, the project has laid a strong foundation for improved customer engagement, streamlined operations, and data-driven decision-making. The system has been thoroughly tested and is ready for deployment, poised to support the company's growth and sophistication.

Future Enhancements

To further elevate the platform, future enhancements could include:

- **AI Integration:** Implementing Salesforce Einstein for predictive product recommendations and customer churn analysis.
- **Chatbot Integration:** Adding a Service Cloud chatbot for 24/7 customer support and order status inquiries.
- **Community Portal:** Developing a Customer Community for loyal clients, offering early access to new collections and exclusive content.
- **ERP Integration:** Integrating with a backend ERP system for seamless financial and supply chain management.
